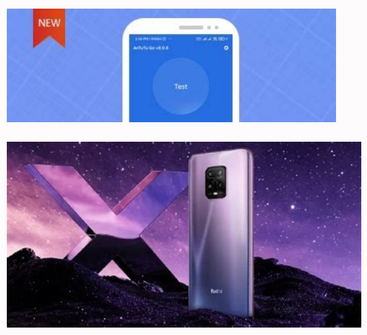
Antutu benchmark ranking mid range phones

Continue



Antutu benchmark mid range phones. Antutu benchmark mid range phones 2021.

The first quarter of 2022 has come to an end. The release of new flagships will gradually decrease after the first quarter, the ranking list of flagship phones in March can therefore basically represent the ranking throughout the first half of 2022. In contrast, the release of new mid-range chips and mid-range models is just starting to increase. After Qualcomm, Samsung and MediaTek upgraded their new flagship chips, the next generation of small upgraded flagships may also be released in the second quarter.This ranking list for flagship phones mainly reflects the performance of each phone, as well as their market recognition and popularity.Let's take a look at the specific data of the March ranking list below. It should be noted that figures in this ranking list were calculated from March 1 to March 31, 2022. The results in the ranking list are average scores instead of highest scores, and thus more representative.No.1: Xiaomi 12 ProAverage score: 981,496Despite being the second phone to be launched with the Snapdragon 8 Gen 1 processor, Xiaomi 12 Pro is still outperforming Moto Edge X30 in terms of sales and market recognition.In addition to the Snapdragon 8 Gen 1 processor, it features a 6.73-inch AMOLED screen with a resolution of 3200x1440p, made from Samsung E5 luminescent material, which is currently the best screen in the industry apart from Samsung's own series.In terms of imaging, Xiaomi 12 Pro is equipped with three 50-megapixel sensors in its rear camera set-up, one being a wide-angle, one ultra-wide, and a telephoto snapper with 2x optical zoom.These configurations are enough to give the Xiaomi 12 Pro some market recognition in this year's Android phone market.No.2: Motorola Edge 30 ProAverage score: 978,019The Motorola Edge 30 Pro is in fact the Moto Edge X30 released for the Chinese market, the two phones are identical in terms of specs and appearance.Lenovo is looking to further open up its mobile market with the launch of its Snapdragon 8 Gen 1 flagship Moto Edge X30. Despite being one of the leading brands in the PC market, Lenovo's business in the mobile market has been less than stellar, many people don't even know it has mobile products and bought Motorola.Lenovo not only first launched Snapdragon 8 Gen 1 processor, but also offered the lowest starting price in the industry at CNY 2,999. However, due to the lack of popularity in the mobile phone market, although the price may attract users, the ultimate success of Lenovo's strategy depends on various factors such as the Moto Edge X30's user experience.No.3: Realme GT2 ProAverage score: 970,727The Realme GT2 Pro is arguably the most eco-friendly phone of 2022, with a recyclable bio-based material used for the back cover and the entire packaging. In addition, it has a high-quality straight screen that is rare to see in the industry. It attracts much attention with both the excellent parameters of a curved screen and the excellent user experience of a straight screen that a curved screen does not have.Realme's phones have also been very good in terms of value for money. As the third phone equipped with the Snapdragon 8 Gen 1 processor, the starting price of this device is only about CNY 3,000, making it a very good choice for users.The following seven products are Xiaomi 12 with an average score of 934,881, Galaxy S22 Ultra 5G (8 Gen 1) with an average score of 919,689, Galaxy S22 Ultra 5G (Exynos 2200) with an average score of 904,778, Galaxy S22+ 5G (8 Gen 1) with an average score of 885,440, Galaxy S22+ 5G (Exynos 2200) with an average score of 862,584, OPPO Find X5 Pro (8 Gen 1) with an average score of 849,583, Galaxy S22 5G (Exynos 2200) with an average score of 839,342.The top 10 flagship models in this month's ranking list are all equipped with the latest processor in 2022. With Snapdragon 8 Gen 1 and Samsung Exynos 2200 both adopting the 4nm process, the mobile phone industry has achieved another upgrade.It’s a shame that there are no models equipped with MediaTek Dimensity 9000 on the list. The Dimensity 9000 also adopts the 4nm process and has received a lot of positive reviews. However, this chip was launched too late, only one new model powered by it was launched in March. We are expecting to see all three processors dominate the market together in next month's list.The mid-range phone market continues to be dominated by the previous generation of chips, the Snapdragon 778G/780G, with a few MediaTek Dimensity models appearing.No.1: iQOO Z5Average score: 558,841No.2: Realme GT MasterAverage score: 541,304No.3: Mi 11 LiteAverage score: 531,079The top three rankings are exactly the same as last month, with just a few hundred points of score fluctuation, which is quite normal.The Snapdragon 778G was the only mid-range chip launched by Qualcomm last year, but some manufacturers are still launching new phones with this processor. The mid-range market seems to be getting less and less attention from Qualcomm, with mid-range chips being updated very slowly and phone manufacturers and users happy to see last year's flagship chips used directly as mid-range chips.However, MediaTek has released two chips this year, the Dimensity 8000 and Dimensity 8100. The starting price of the new model equipped with these two chips has been as low as CNY 1,999. If Qualcomm still does not pay enough attention to the sub-flagship and mid-range market this year, the market share may be taken by these two chips from MediaTek.The following seven products are Mi 11 Lite 5G NE with an average score of 514,344, Realme 9 Pro+ with an average score of 506,761, Galaxy A52s 5G with an average score of 501,068, Galaxy M52 5G with an average score of 484,257, Redmi Note 11 Pro 5G with an average score of 464,782, OPPO Reno 6 5G with an average score of 440,040, Galaxy A53 5G with an average score of 420,311.Mid-range phones are equipped with a more diverse range of chips, with the Snapdragon 778G, Dimensity 920, Dimensity 1200 and Dimensity 900 all appearing on the list. But unfortunately, there are no longer any Huawei phones to be seen, along with the HiSilicon Kirin chips. Not sure when we will see new Huawei phones on the list again.The new models powered by the Dimensity 9000 and Dimensity 8100 just hit the market in March, and more new models powered by these two flagship processors from MediaTek will be released in April. We will see whether Qualcomm's chip can continue to rank first next month. Home > AnTuTu Benchmark v9 (Android) The number of phones released in the market in April was significantly less than that in the first quarter. In addition to a few major manufacturers releasing flagship phones this month, most of the other manufacturers mainly update mid-range models, so the performance ranking list of flagship phones in April did not change much.There are many highlights in the mid-range market this year. Most of the mid-range models are using the last generation of flagship processors - Snapdragon 870, Snapdragon 888, etc., and many are using MediaTek’s two new sub- flagship processors Dimensity 8000 and Dimensity 8100. Considering the sharp increase in the number of cost-effective new models, this time we have added a performance ranking of sub-flagship models to the list. The score difference between flagship and mid-range phones is about 300,000 points, so we believe that the addition of the sub-flagship will give the list a good transition and better meet everyone's expectations.Let's take a look at the specific data of the April ranking list below. It should be noted that figures in this ranking list were calculated from April 1 to April 30, 2022. The results in the ranking list are average scores instead of highest scores, and thus more representative.No.1: Red Magic 7Average score: 1,038,771Every new generation of Nubia's Red Magic game phone since its release has had impressive running scores that have completely surpassed the older gaming phone, the ROG Phone. The new Red Magic 7, equipped with a new generation of Snapdragon 8 processor, ranked at the top of the overseas Android phone performance list in April with an average running score of more than one million points. It is also the only flagship phone on the list with a score of more than one million, which once again proves the strength of the game phone in terms of performance.In addition to the Snapdragon 8 Gen 1 processor, Red Magic 7 features a 6.8-inch AMOLED screen with a resolution of 2400x1080p, supports up to 165Hz refresh rate, 720Hz touch sampling rate, tripod pixel arrangement, and DCI-P3 100% wide color gamut.In terms of imaging, the rear is a 64-megapixel main camera + 2-megapixel macro + 8-megapixel wide-angle, and the front is an 8-megapixel selfie lens. The phone is equipped with a 165W gallium nitride charger, which supports up to 120W fast charging, and the battery capacity is 4500mAh. The starting price for the 8GB + 128GB version of this phone is CNY3,999.No.2: Redmi K50 ProAverage score: 986,840It can be seen that Xiaomi is paying more and more attention to the Redmi phone. The Redmi K50 Pro is Redmi's latest K-series flagship phone released this year. It is the world's first phone to be sold with MediaTek's Dimensity 9000 processor. The phone's average score of about 980,000 points proves MediaTek's strength. Impressively, the eight phones that came after it are equipped with Qualcomm's Snapdragon 8 Gen 1 chip and Samsung's Exynos 2200 chip, which use this year's latest 4nm process, yet they were still surpassed by Dimensity 9000.The running scores of gaming phones are generally higher, so except for the gaming phone Red Magic 7, the average running scores of all other phones with Snapdragon 8 Gen 1 processors are surpassed by the Dimensity 9000, and the Samsung Exynos 2200 is even about 70,000 points lower.Why is there only one phone equipped with Dimensity 9000 in the top 10 of the flagship performance list? Because there are only three new Dimensity 9000 models released in the market so far, the OPPO Find X5 Pro Dimensity version is delayed due to the epidemic, and the Vivo X80 Dimensity version is only available in May.So after a while, if MediaTek's production capacity keeps up, the top 10 flagship models will change dramatically. MediaTek does have the strength to compete with Qualcomm this year.No.3: Mi 12 ProAverage score: 982,228As we mentioned earlier, Xiaomi has increased the focus on the Redmi series, so this time we dramatically see the Mi 12 Pro coming in behind the Redmi phone. As the world's second flagship phone equipped with Snapdragon 8 Gen 1, Mi 12 Pro has undoubted performance and configuration. However, the Mi series is now more focused on the high-end market, and the Redmi is different. Redmi K50 Pro features a 2K resolution straight screen, Dimensity 9000 processor, and 120W fast charging, but is priced at only CNY 3,000, which would have been hard to imagine a year ago.Compared with the Redmi series, the Mi series gets more profits from the market, which also supports Redmi to sell such a good configuration at such a low price to a certain extent.The following seven products are Motorola Edge 30 Pro with an average score of 977,395, Realme GT2 Pro with an average score of 966,916, iQOO 9 Pro with an average score of 954,336, Mi 12 with an average score of 948,391, Galaxy S22 Ultra 5G (8 Gen 1) with an average score of 942,849, Galaxy S22 Ultra 5G (2200) with an average score of 914,476, Galaxy S22+ 5G (8 Gen 1) with an average score of 905,520.Last month the top 10 flagship models were all equipped with Snapdragon 8 Gen 1 and Samsung Exynos 2200 processors, in April the Dimensity 9000 finally appeared on the list and ranked second.Although the release of the Dimensity 9000 processor is relatively late, the market recognition of MediaTek is much higher than Snapdragon and Samsung this year. The number of flagship phones powered by the Dimensity 9000 could end up having a similar market share to Qualcomm. Samsung Exynos 2200 may gradually withdraw from the market.Next, let's look at the newly added sub-flagship phones list. Compared to high-end flagships, the competition in the sub-flagship market is more intense.No.1: Realme GT Neo 2Average score: 731,589The model at the top of the list is the GT Neo 2 from Realme, which was released in 2021 and is equipped with the Snapdragon 870 processor, which is the same processor that has been used in many new sub-flagships this year. Manufacturers are very familiar with this chip and it is very suitable to be used as a sub-flagship.However, GT Neo 3 was also released last month, and the processor upgraded to Dimensity 8100, which is equivalent to Qualcomm’s Snapdragon 888. Therefore, GT Neo 2 will not be at the top of the sub-flagship list for a long time, and it is likely to be replaced by GT Neo 3 in the future.No.2: Google Pixel 6Average score: 728,567No.3: Google Pixel 6 ProAverage score: 722,936In second and third place are the Pixel 6 series from Google, both of which were also released last year.The Pixel 6 is equipped with a 6.4-inch AMOLED screen, which supports a 90Hz refresh rate, while the Pixel 6 Pro is a 6.71-inch AMOLED screen, supports a 120Hz refresh rate.Instead of using Qualcomm processors, both the Pixel 6 and Pixel 6 Pro opted for a chip designed in-house by Google. Google calls its chip Tensor and also customizes the chip's features. For example, the Tensor processor is customized for Pixel's computational photography function, providing Pixel users with features they are familiar with, while also being further optimized.This strategy is somewhat similar to Apple's self-developed M1 series chips, in addition to getting rid of the dependence on chip manufacturers, but more importantly, the chip can better serve their own mobile phone’s software. We believe it will be a key direction in the future development of smartphones, but currently only Apple and Google have the ability to do so.The average score of Google Tensor is close to that of Snapdragon 870, showing strong performance. However, the starting price of nearly CNY 5,000 is a bit too expensive. Hopefully, Google's next-generation chip can have the same high-cost performance as Mediatek Dimensity 9000.The following seven products are Motorola Edge S Pro with an average score of 713,813, Redmi K40 with an average score of 707,854, Black Shark 4 average score of 706,606, Mi 11X with an average score of 704,933, Poco F3 with an average score of 704,634, OnePlus 9R with an average score of 693,954, Realme GT Neo with an average score of 692,497.Seven of the top 10 models in the first-ever sub-flagship ranking are equipped with Snapdragon 870 processor. Although Qualcomm’s processors have heat problems, they will still be very popular in the market as long as there is an appropriate price, and the performance of the Snapdragon 8 series processor is certainly much better than that of the 7 series.MediaTek's new Dimensity chips have not yet appeared on the list, because although there are several cost-effective new models equipped with these chips in the Chinese market, there are no such models released overseas at present. We believe that after a while MediaTek will also make get a good ranking on the global sub-flagship list.From the overall running score of the list, the scores of mid-range models are between 490,000 and 550,000, and the scores of sub-flagship models are between 690,000 and 730,000. The sub-flagship models are generally the ones with the highest user attention.Finally, let's take a look at the ranking of mid-range phones.No.1: iQOO Z5Average score: 559,591No.2: Realme GT MasterAverage score: 544,862No.3: Mi 11 LiteAverage score: 532,023The following seven products are Realme Q3s with an average score of 530,806, Motorola Edge 20 with an average score of 526,824, Mi 11 Lite 5G NE with an average score of 516,932, HONOR 50 with an average score of 511,424, HUAWEI nova 9 with an average score of 508,020, Galaxy A52s 5G with an average score of 501,567, Galaxy M52 5G with an average score of 490,315.The mid-range list looks more like a test run for the Snapdragon 778G processor, as nine of the top 10 phones are powered by this processor. The other Snapdragon 780G chip has been discontinued and replaced with the Snapdragon 778G, so the two chips are actually equivalent to the same one. The Mi 11 Lite, which is powered by Snapdragon 780G, has also been replaced with snapdragon 778G, proving that there is little difference between the two chips.The Snapdragon 778G is launched globally by the Honor 50 series, which is the first blockbuster product brought by Honor after its independence, and also marks Honor's official joining Qualcomm Snapdragon camp. Specific performance parameters, the snapdragon 778G is manufactured using 6nm process technology, CPU is composed of four 2.4Ghz A78 cores + four 1.8Hz A55 cores, and GPU is integrated with Adreno 642L. According to Qualcomm, the Snapdragon 778G has a 40% increase in both CPU and GPU performance compared to the Snapdragon 768G.That's all for the global Android phone performance list in April 2022. The newly added sub-flagship list compares models with average running scores between 690,000 and 730,000, giving people a better reference when making choice.
